TERRITORY	Space which can be urbanized	
METROPOLIS	Immeasurable, incomprehensible and elusive city; a city without form	
CYBERSPACE	The city as a graphic interface in which the information that flows through computer networks is visualized	
NATURE	Inner force which governs the city's growth	
LANDSCAPE	A part of the city or from nature which becomes a spectacle when contemplated from a distance	
CENTRE	A privileged place in the city which is a depositary of its historical memory and its identity	
PERIPHERY	The city which is not at the centre and, therefore, lacks identity	
DENSITY	Concentration of services, transportation and residence in an urbanized territory	
CONSTRUCTION	An industrial sector depending on the continued expansion and renovation of cities	
SPECULATION	Obtaining profits from urban capital gains	
TRANSFORMATION	The continuous process of adaptation of the city to its time	
FRAGMENTATION	The decomposition of the continuum of the city in spatio-temporal fragments	
DEGRADATION	The decline of the city conveys the degradation of citizens' lives	
OPULENCE	Abundance and waste of resources in some parts of the city to the detriment of others	
COMMUNICATION	Networks that facilitate the exchange of ideas and information in the city, and beyond the city	
TRANSPORT	Infrastructures that enable the mobility of people, vehicles and goods in the city	
FLUX	Movement of people, vehicles, goods and information through communication and transportation networks	
REASON	Planning of the development of the city and optimization of the resources necessary for its operation	
STRUCTURE	Spatial ordering adopted by a natural or artificial, architectural or urban system	
EXPRESSION	Demonstration of the vitality and character of the city through cultural events and unique buildings	
AESTHETICS	Objects and images, characters and stories which are associated to the city and give style to it	
IDENTITY	The awareness that the city has of itself, which is identified with an idealised image of its past or its future	
ICON	Image which represents the city and distinguishes it from other cities	
LOGO	Image synthesizing the qualities of a city to turn it into a commodity	
FETISH	The idols worshipped by the city provoke both fear and desire	
SIMULACRUM	The city appearing to be what actually is not: a city	
FANTASY	The cities imagined by the mind, which cinema, photography and literature make visible	
MARKETING	The city is merchandise, object of desire and consumption for tourists	
SPECTACLE	The city as representation: an image of itself contemplated by itself	
EVENT	Meaningful episodes taking place in the city	
HETEROTOPY	Juxtaposition of multiple incompatible spaces in one single place

THE CONSTRUCTION PROCESS OF THIS BOOK

The photographs and photomontages included in this book have been created by students on SDR Sistemas de Representación (*Systems of Representation*) courses taught by professor Leandro Madrazo between 2000 and 2007 at the School of Architecture La Salle, Barcelona. The aim of these courses was to foment the use of photographic images as a means of reflecting upon the contemporary city, exemplified by the city of Barcelona.

Based on a selection of images created during the different courses, we began the laborious task of organising them into topics, linking them to concepts and putting them into groups. Over a period of several months, during working sessions with the participation of the three teaching assistants who have worked with us on putting together this book – Marta Sabat, Mario Hernández and Albert Vallverdú – we started to reveal the meanings contained within the images. The photographs and photomontages were first organised into topics which took on the title of a recognised publication in the literature on the city and urbanism. Next, by individually examining each image, we extracted a set of concepts that characterised the city. In a reverse sense, the concepts derived from the images were linked to other images, creating relationships between them through words. Afterwards, we began grouping the images and describing the idea of a city included within each group. Finally, the images were organised based on two opposing poles, so that the image

located at one end would represent an idea of the city opposite to that of the other. Other images were placed between both extremes in order to show a transition between a concept and its opposite. In this way, we managed to create a structure which related image and word, thus obtaining a view of the contemporary city based on their interaction.

This process of constructing meanings based on the reciprocal action between word and image is continued in this book. Topics, concepts and groups make up a structure that holds the images together and facilitates their interpretation. Readers can trace their own path through the pages, moving from an image to a concept or from one image to another, following their own intuitions thereby continuing the reflection on the city set out in this book.

The knowledge acquisition process entailed in the journey through the network of images and words contained in this book can be followed up at www.bcnreflexions.net. This environment enables us to do what the material limitations of the book do not permit: to introduce new images and add concepts them, to discuss them and to group them in different ways. In Internet, the structure that supports the images and concepts is no longer conditioned by the limits imposed by the book: it can free itself of them and become an open and participative structure that is continually evolving.

THE CITY REPRESENTED PHOTOGRAPHICALLY

Leandro Madrazo

THE CITY

Primordially, the city is a settlement (*urbs*) inhabited by a community of individuals who assume rights and obligations (*civitas*) in order to establish themselves within a legal and administrative organisation (*polis*).

Considered as material reality, the city is an aggregation of constructions that occupy a territory. The traditional city is made up of edifices (housing and public buildings) that determine spaces (on the outside, streets; on the inside, rooms) and monuments which establish places. In the modern city, the structure formed by the transport networks (highways and motorways; tram, subway and train lines) is juxtaposed onto the original physical structure. Utilities (water, gas, electricity, communication) and sewage systems are also an integral part of the modern city, even though they are usually invisible.

The city is a living organism in a continual process of transformation: an artificial nature, created by man. The walls of the medieval city restricted its development. In order to grow, the city had to knock these walls down and build new ones further out. Thus the city grew like a tree, expanding gradually from a nucleus.

A new form of urban development sprang up with the industrial city of the nineteenth century: the expansion plans. The city stopped growing through the successive addition of concentric rings to project at once outwards by means of axes and grids that gave shape to

the surrounding area. The image of the city as an urbanised area implanted in the territory started to vanish.

Once the city had gone beyond its original limits, it no longer had shape but it turned into structure. The large modern city appeared at the beginning of the twentieth century: the metropolis. A vast city that is hard to apprehend, an amorphous city. Urban space was no longer continuous and hierarchised, but it became an amalgam of heterogeneous and disjointed fragments. The process of fragmentation and recomposition of urban space has continued until the modern conurbation came into being. Nowadays, the city no longer grows continually through simple increases in size, but it expands by connecting discontinuous spaces – neighbourhoods, districts and also towns – giving rise to a new urban structure: the metapolis (Ascher, 1995). The contemporary city is no longer understood as a form that has to be prefigured, rather as a process in motion which needs to be understood in order to be able to intervene in it.

The city does not just determine and structure space, but it regulates movement through it. In the modern city, people and vehicles transit through streets and squares, and circulate through specialised transport systems (cars, buses, trams and subway). Each form of movement (on foot or by vehicle, by bus or on the subway) allows urban space to be perceived and structured in a particular way. As we walk around the city we can appreciate the details

shopping mall of the contemporary city. Since the advent of the Internet, it is no longer necessary to carry out these activities in the city. In the intangible and dislocated space of the Net it is possible to meet other people on social networks, debate current affairs in blogs and forums, buy products and contract services in virtual shops, and be entertained by watching a film or taking part in a videogame. As cyberspace becomes a city of bits by taking on some of the activities that once gave meaning to urban life (Mitchell, 1996), the city tends to become de-urbanised. Although it conserves the appearance of a city, the form of the city is no longer necessarily the mere expression of urban facts.

PHOTOGRAPHY

In its conventional meaning, a photographic image is a print inscribed by rays of light on a surface sensitive to light. This causal link between the object and the image is considered a characteristic of photography that distinguishes it from other techniques of representation.

With digital technology a photograph has changed from being a print to become a record of information. A digital image is not an inscription on a surface, but rather a set of data that indicate the colour of each pixel that makes up the image. Despite this, it continues to use the same name – photography, engraving with light – to refer to the image obtained with both analogical and digital procedures.

In photography we have to distinguish two differentiated situations which are not always directly related: that of the creation of the image, and that of its reception in a certain context. The first situation concerns the photographer and the means of production; the second the spectators who consume the images and the means of distribution. The practice of photography takes place between one and another situation.

Supposedly, the photographic image resembles what has been photographed. However, the relationship between a photograph and what it represents is not just analogical. According to Charles S. Peirce, three types of sign may exist: iconic, which maintains a relationship of likeness with what it represents (a drawing, a painting); symbolic, which has an arbitrary relationship based on conventions (the words in the language); and indicial, which keeps a causal relationship with what it stands for (the prints left along the way indicate that someone passed by). By applying Peirce's theory of signs to photography, this would be mainly an iconic and indicial sign. Photography shares the condition of iconicity with figurative painting. Its indicial nature, however, is considered specific to photography (some pictorial practices notwithstanding, such as body art, for example, in which the painting can also be a print, left on the canvas by bodies impregnated with paint).

A photograph can be an image or a sign, or both at once. As an image, a photograph reproduces the appearance of the object that has engendered it. As a sign, a photograph points directly to things, and to the knowledge we have of them. Simultaneously understood as an image and a sign, a photograph would be an 'emanation of the referent' (Barthes, 1981).

A photograph is an 'image of' in the sense that it belongs to the object that has generated it (photographs are 'taken'). However, once it exists as an image – printed on paper, visualised on a screen – a photograph acquires autonomy, and can then break the ties that kept it with the object that engendered it.

As occurs with any image, a photograph is open to the interpretations made by its observer. The gazes projected on the photographic image bestow it with meaning. The meaning, or meanings, of the photograph is the result of the sum of the gazes that have been deposited on it. In this sense, returning to Peirce's theory of signs, a photograph could also be considered as a symbol

Through photomontage, Dadaists such as Hannah Höch and Raoul Hausmann aimed to break photographically represented reality into pieces to then reassemble them in a different order (Ades, 1976). Through this operation of assembly and disassembly these artists wanted to expose the processes in which reality is built. Beyond aesthetic speculation, photomontage proved to be an effective instrument for social and political critique. John Heartfield, for example, considered photomontage to be a weapon for the class struggle that the revolutionary artist (as distinguished from the bourgeois artist) should use to agitate the masses. Heartfield's photomontages printed in the magazine *AIZ* (*Arbeiter Illustrierte Zeitung*) contributed to revealing and spreading the hidden links between politics and business during the emergence of Nazism in Germany.

However, we have to distinguish between photomontage as a characteristic of an image, and photomontage as a technique (cutting and pasting images physically or using digital techniques). As opposed to the technique of photomontage, the attribute of photomontage is inherent to any photograph. A photograph becomes a photomontage when it contains images that are recognised as spatially or temporally incoherent. It is not necessary to cut and paste images to create discordances: an adequate selection of the objects when they are being photographed is sufficient.

The way of portraying a certain type of object or situation conform a mode of seeing which is identifiable to the subject represented. Thus, what characterises a photographic genre (nature, architecture) is not so much the objects represented (plants, buildings), but rather a certain way of seeing them through the camera. This gaze, once fixed, can be transposed from one type of object to another in order to thereby observe a city with the specific view of a landscape, or photograph a plant as if it were an ornamental detail of a building (Mattenklott, 1994).

Through photography it is possible to construct different ways of looking at reality which can be characterised by the object photographed, but also be the product of the vision of the artist photographer. For example, Aleksandr Rodchenko, with his intense analytical gaze, manages to draw out from the reality observed through his camera abstract compositions of lines and planes.

According to Francesc Català-Roca, photography is a subtractive system as it appropriates something that existed previously. Painting, by contrast, is an additive system, as it is based on a white canvas that needs to be filled in (Català-Roca, 1995). This distinction is based on the process of materialisation of the photographic image. However, from the point of view of image perception, a photograph – such as those by Moholy-Nagy or Rodchenko – can also be constructive, insofar as the image perceived is the result of putting together elements that photography has formerly dissociated.

Photography is not limited to the act of taking an image, but also to reproducing it. Initially, with the daguerreotype the image was unique. After William Henry Fox Talbot's invention, it was possible to reproduce images from a negative. Until the advent of digital photography, the reproduction of photographic images consisted in creating copies from an 'original' image. With digital technology the distinction between the original and copy becomes meaningless. Digital photography has increased to unexpected limits the possibility to reproduce images and it has made possible the instantaneous distribution of images coded into bits through telematic networks.

THE CITY AND PHOTOGRAPHY

A photograph is an image of the world and hence can only record the reality that exists on the other side of the camera: nature and its phenomena, and artefacts built by man. If what is

THE PEDAGOGY OF THE IMAGE IN CONTEMPORARY CULTURE

Leandro Madrazo

VISUAL CULTURE

The ubiquity and promiscuity of the image characterise contemporary culture. Images do not just depict the world – making it visible so that it can be understood –, but they have also become inherent to it: they are not a copy of things, but instead adhere to the things themselves. Besides, the contamination of the world by the image questions the distinction between subject and object. The image no longer simply acts as a mediator between the subject and the world; it has taken over both, alienating the subject from the world and substituting it with its image.

This process of the world being appropriated by images has principally taken place over the last half century. In his book *Vie et mort de l'image* (Life and death of the image), Régis Debray argues that between 1960 and 1980, Western civilisation began to move from a culture based on writing (*logosphère*) and the visible (*graphosphère*), to a culture based on visuality (*vidéosphère*). The omnipresence of the image has led some authors to fear the disappearance of the word and the thought linked to it (*logos*). In his text *Homo videns*, Giovanni Sartori thus appeals to Platonic doctrine to revindicate the existence of two differentiated spheres: the intelligible world of ideas and concepts, and the sensitive world perceived by the senses. Sartori identifies thought with language and thereby denies that image has any conceptual value. In comparison to the Italian author, Susan Sontag concedes a conceptual value to images in her book *On Photography*. Reversing the Platonic order, Sontag considers that images, and no longer

ideas, constitute our true reality. In her view, photographic images make up an immaterial reality full of meanings, and are thereby capable of turning reality itself into a shadow.

Beyond the alleged antagonism between the culture of the image and the culture of the word, we should be aware that both image and word are inextricably linked from the cognitive point of view. An image is not just perceived but it is also interpreted through words. Likewise, words are not just read or listened to but their meanings are also imagined.

The rise of the image in contemporary culture should not necessarily lead to the disappearance of language and the word. In fact, the issue at stake is not the substitution of the word for the image, but rather the need to establish new relationships between them which give rise to other ways of thinking about and understanding the world. The emergent culture of the image requires new cognitive capacities that are different to those acquired through the word. Nevertheless, for us to develop these capacities we need to break away from the identity between thought and language, between concept and word, and accept, as suggested by Debray, the possibility of visual thought that is not based on the combination of signs.

In the book *Analogous and digital*, the designer and teacher Otl Aicher maintains that thought based on the image is not lineal, but associative; that is to say, it does not try to reach conclusions but discover relationships. Thought based on image corresponds to the characteristics of the latter.
